Web Integration of Tableau Dashboards and Story

Objective:

To integrate the developed Tableau dashboards and story into a responsive website so that the visualizations can be easily accessed and interacted with online.

Tools & Technologies:

- **HTML5** and **CSS3** (for structure and styling)
- **Bootstrap Template** (for responsive layout)
- **Flask (Python)** (for a simple backend to serve pages)
- **Tableau Public** (for embedding dashboards and story)

Process:

1. **Template Setup**

- Downloaded a Bootstrap template.
- Organized folders: `static` (for images and CSS), `templates` (for HTML files).
- Removed unnecessary template files and customized only required sections.

2. **Embedding Dashboards & Story**

- Used Tableau Public embed codes for:
 - Dashboard 1, Dashboard 2
 - Storyboard
- Placed embed codes into respective HTML sections.

3. **Backend Setup**

- Created a simple Flask app (`app.py`) with routes:
 - `/` → Home Page (introduction & overview)

- `/about` → About Page (project details with image)
- `/dashboards` → Page displaying dashboards
- `/story` → Page displaying story
- Linked HTML templates with Flask routes.

4. ****Testing & Deployment****

- Ran Flask locally (`python app.py`).
- Tested navigation between pages and responsiveness.
- Verified that dashboards and story load properly within the website.

Outcome:

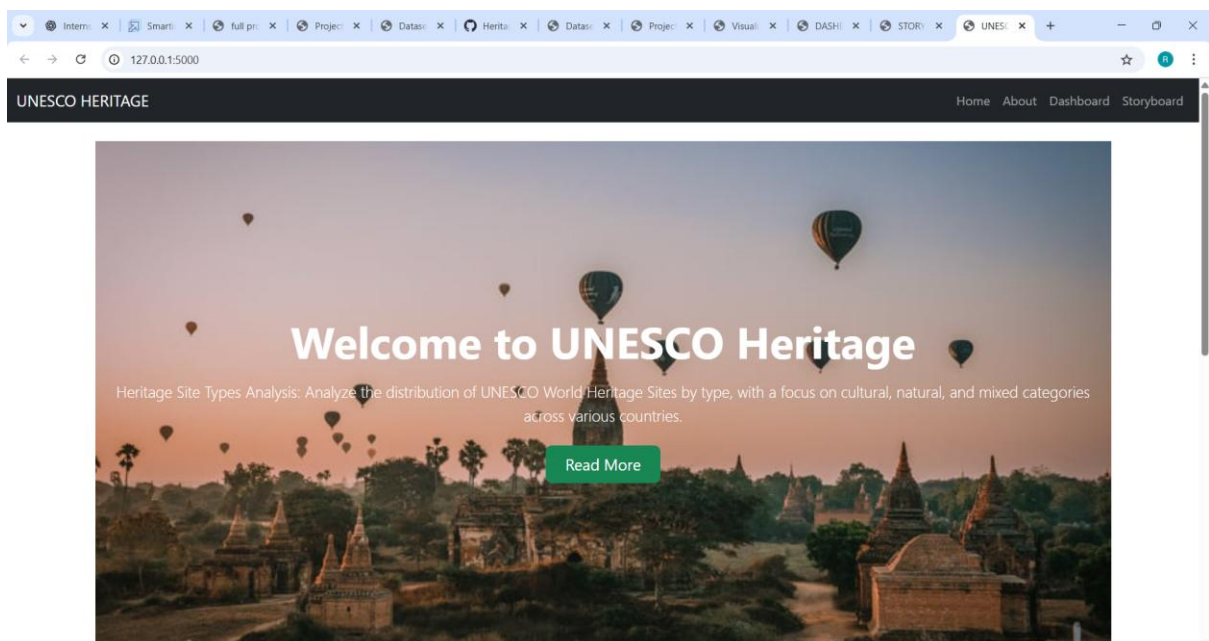

- A fully functional website that showcases:
 - Dashboard 1: UNESCO World Heritage Site Overview
 - Dashboard 2: UNESCO Danger Sites Overview
 - Storyboard combining both dashboards

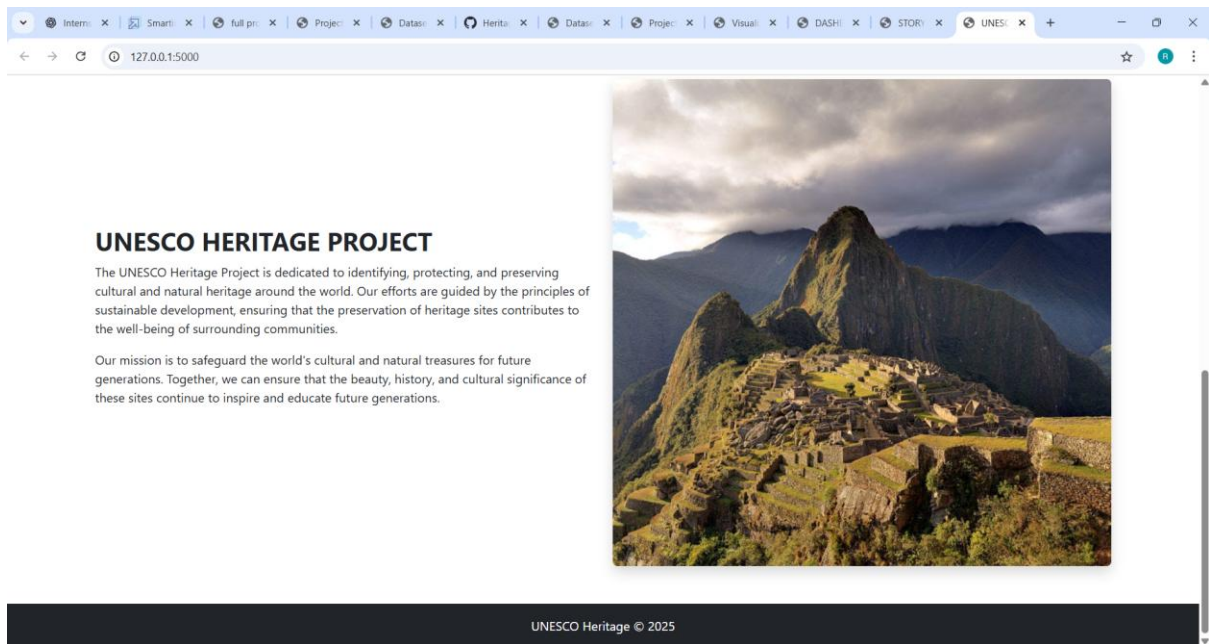

Key Features:

- Clean responsive UI with Bootstrap
- Embedded Tableau visualizations
- Simple Flask backend to serve the pages
- Integration ready for GitHub and local demonstration
